(54) Title: METHOD FOR SCREENING FOR ANTI-AMYLOIDOGENIC PROPERTIES AND METHOD FOR TREATMENT OF NEURODEGENERATIVE DISEASE

(57) Abstract: The methodologies of the present invention demonstrate that a critical balance between pro- and anti-amyloidogenic molecules exists that regulates amyloid formation and cell death in Alzheimer's disease and Parkinson's disease. β -Synuclein, the non-amyloidogenic homologue of α -synuclein, is a negative modulator of α -synuclein and $A\beta$ aggregation, having neuroprotective properties against α -synuclein and $A\beta$ neurotoxicity and that β -synuclein and therapeutic agents derived therefrom block amyloidogenesis and neurodegeneration in vivo. The method of the present invention establishes that β -synuclein blocks $A\beta$ aggregation either by direct inhibition of $A\beta$ amyloidogenesis or indirectly via either α -synuclein or its 35 a.a. NAC region, inferring neuroprotective characteristics within the effected cells. The generation of a transgenic mouse line and a cell-free system overexpressing α -synuclein characterizes the mechanisms by which β -synuclein blocks α -synuclein and $A\beta$ aggregation and that this mechanism offers protection to the cell against amyloid formation as seen in the pathologies of Alzheimer's disease and Parkinson's disease.
